## 1 INTRODUCTION

The ST7FLITE0 is a member of the ST7 microcontroller family. All ST7 devices are based on a common industry-standard 8-bit core, featuring an enhanced instruction set.

The ST7FLITE0 features FLASH memory with byte-by-byte In-Circuit Programming (ICP) and In-Application Programming (IAP) capability.

Under software control, the ST7FLITE0 device can be placed in WAIT, SLOW, or HALT mode, reducing power consumption when the application is in idle or standby state.

The enhanced instruction set and addressing modes of the ST7 offer both power and flexibility to software developers, enabling the design of highly efficient and compact application code. In addition to standard 8-bit data management, all ST7 microcontrollers feature true bit manipulation, 8x8 unsigned multiplication and indirect addressing modes.

## PIN DESCRIPTION (Cont'd)

#### Legend / Abbreviations for Table 1:

Type: I = input, O = output, S = supply

In/Output level: C= CMOS 0.15V<sub>DD</sub>/0.85V<sub>DD</sub> with input trigger

 $C_T = CMOS \ 0.3V_{DD}/0.7V_{DD}$  with input trigger

Output level: HS = 20mA high sink (on N-buffer only)

Port and control configuration:

Input: float = floating, wpu = weak pull-up, int = interrupt <sup>1)</sup>, ana = analog

- Output: OD = open drain  $^{2)}$ , PP = push-pull

The RESET configuration of each pin is shown in bold which is valid as long as the device is in reset state.

In the interrupt input column, " $ei_x$ " defines the associated external interrupt vector. If the weak pull-up column (wpu) is merged with the interrupt column (int), then the I/O configuration is pull-up interrupt input, else the configuration is floating interrupt input.
